

Commissioners,

I invite you to question, the implementation of Wireless Internet Service Providers (WISP) that will use part 2 and part 5. WISPs should be able to broadcast over certain frequencies so as to not interfere with unregulated frequencies. These wireless providers will prosper but to what cost to other devices and technologies using the 2.4 GHz frequency.

By making it easier for WISPs to obtain equipment authorizations and install better antennas, this will only allow WISPs to grow and thus over-saturate the channels of the 2.4 GHz (i.e.) which allows phones, 802.11a,b,g and baby monitors to communicate.
